FY 1997

Message from the Commissioner

Enclosed is the US Customs Service "FY 1997 Report on Trade Compliance Measurement." Results found in this report enable Customs to assess its own performance relative to revenue collection and enforcement of Customs trade laws. This report provides the basis for Customs to improve the efficiency and effectiveness of its operations. It also serves as the basis for individual importers to work with Customs to assess their performance and to improve their compliance.

This report includes the following:

- An introduction to the purpose of measuring trade compliance and an explanation of the Customs compliance system.
- A summary of overall compliance measurement highlights and tables on specific import areas.
- A summary of a separate North American Free Trade Agreement (NAFTA) compliance measurement.
- The complete FY 1997 Report containing detailed statistical tables and an indepth explanation of sampling methodologies.

The mission of the United States Customs Service is to ensure that all goods and persons entering and exiting the United States do so in compliance with all United States laws and regulations. The work reflected by this report ensures that Customs is improving the quality of its trade operations, providing maximized service to the importing community, setting priorities and properly allocating resources. This report is the result of hard work put forth by our dedicated field personnel throughout the country, who are the essential component of mission achievement.

INTRODUCTION

This report is required by the Customs Modernization Act included as part of the North American Free Trade Agreement (NAFTA) Implementation Act (Public Law 103-182). Its purpose is to provide an objective assessment and measurement of compliance with United States trade laws and regulations. The data in this report represents the basis for Customs new approach to maximizing its effectiveness by developing strategies and methodologies to meet the demands created by the continuing growth of international trade. The report also provides Customs the opportunity to present a summary of the key initiatives undertaken to address more effectively the compliance issues identified through our measurement program.

In Fiscal Year (FY) 1997, Customs processed over \$845 billion in import transactions. This represents more than a 100 percent growth over ten years, while resources remained relatively static. With personnel located at over 300 ports of entry, Customs has re-organized to set up a system of focused enforcement utilizing methodologies geared to maximizing port effectiveness and integrating operational processes. The importance of trade compliance cannot be overstated as the United States continues to negotiate international agreements often dependent on compliance with laws, rules, and regulations governing eligibility for duty-free entry of goods. Compliance is also the key to collecting revenue, as well as protection of the country from violative imports, which fall under diverse trade issues such as Intellectual Property Rights, Public Health and Safety, and Anti-Dumping.

All trade-related activities of Customs have been shaped by the Customs Modernization Act. Customs now shares responsibility with the importing community for achieving maximum compliance of U.S. trade laws and regulations, but importers must demonstrate reasonable care to comply with such laws.

The National Compliance Measurement Program officially began with the signing of Customs Directive 099-3550-069, issued on April 7, 1994. In FY 1995, a national compliance measurement of importations was conducted creating a compliance "baseline." The FY 1995 results and Customs strategic planning in the trade area helped shape the FY 1996 effort. In particular, there was intense focus on newly created Primary Focus Industry areas. FY 1997 brought the full integration of Customs account-based initiatives and the related Compliance Assessment Program into the Compliance Measurement sampling. In FY 1998, Customs will undertake specific initiatives to ensure increased compliance is achieved.

In response to the Government Performance and Results Act (GPRA) and to establish benchmarks for its operations, Customs has published and incorporated into its annual and strategic plans the following trade goals:

Achieve 90% overall trade compliance Achieve 95% compliance in Primary Focus Industries Collect at least 99% of revenue Increase customer satisfaction.

A Trade Compliance Board of Directors reviews, endorses and recommends Customs plans for trade operations and the Trade Compliance Process. This coordination maximizes efficiency, identifies new options for enhancing future performance, and ensures that Customs provides uniform service to the public.

Customs is evolving from a transaction-based regulatory agency. In the past, Customs served the public by engaging two sometimes contradictory trade imperatives: (1) release goods into the economy in rapid fashion; (2) enforce trade and other laws by preventing violative goods from entering the country. While still maintaining vigilance on individual imports, Customs continues to move away from transactional processing toward account management, industry analysis, and further development of analytical tools and techniques.

To achieve its Trade Compliance goals, Customs must meet a number of challenges. Customs must develop the analytical capabilities of it employees to maximize compliance and proactively enforce critical areas. Increasing customer satisfaction, the most difficult goal to measure, requires continued facilitation of compliant imports. To use our limited resources in the most effective way possible, Customs must also better focus resources towards areas with the highest risk for deliberate significant trade violations.

Integrated Trade Compliance System: Foundation for Customs Trade Risk Management Strategy

In order to facilitate the movement of compliant trade, raise overall compliance, and enforce critical laws, Customs implemented a risk management strategy. Risk management is a three-part process to establish the means to **identify** risk, **determine** the significance of the risk, and **develop** a plan to address the risk. Customs risk management strategy, known as the Integrated Trade Compliance System, uses statistical methodologies designed to provide an objective measure of the compliance of trade. There are two measurement components to the Integrated Trade Compliance System: Compliance Measurement (CM) and Compliance Assessment (CA).

CM measures the compliance of individual transactions based on actual cargo inspections and port reviews of documentation. The results provide tariff-based compliance rates which are applied to industries and, when the sample size is sufficient, to individual accounts (importers). CA uses the same statistical methodology to assess an importing company's systems, evaluating business procedures in an audit-like environment. This post-transaction review allows Customs to make a more precise determination of risk at the company level. The two processes, CA and CM, together enable Customs to identify problems and make a specific evaluation of the risk of non compliance that an individual company poses. Once a level of risk is identified, Customs can select the appropriate response to the risk.

Responses to the risk determination fall under two processes: informed compliance and enforced compliance. Account Management is Customs principal means for informed compliance, working with accounts to raise compliance and reduce risk. Enforcement actions are employed to address non-compliance or deliberate violations.

Compliance Measurement

In FY 1995, Customs established a comprehensive measurement of the compliance of international trade entering the commerce of the United States. This measurement, simply termed Compliance Measurement (CM), produces a statistically valid compliance level of international trade importations. CM covers the entire spectrum of the Harmonized Tariff Schedule (HTS) of the United States, running throughout each fiscal year. FY 1998 is the fourth year of statistically measuring virtually all importations entering every port of entry into the United States. Compliance measurement requires a scientific approach for accurate compilation of data collection, analysis and projections.

Compliance measurement is the primary tool to assess the accuracy of port of entry transactions and determine the compliance rate for all imported commodities. This statistical measurement provides the necessary information to determine whether revenue collection is maintained at, or above, 99% of total duties owed to the U.S. Government and provides for the verification of proper compliance with trade agreements such as NAFTA.

Integrating Compliance Assessment and Compliance Measurement

After their initial development as separate systems, in FY 1997 Compliance Assessment (CA) was integrated into Compliance Measurement (CM). By identifying highly compliant, high volume national accounts through CA, Customs focuses resources on non-compliant entities within CM. By concentrating resources on non-compliant entities, Customs obtains critical information on non-compliance. Each year the integrated system is updated with CA and CM data on potential non-compliance, allowing Customs to allocate resources in those areas. Accounts which are highly compliant, with reasonable care systems, will be sampled via port transactions at the minimum level to provide corroboration of their continued compliance. Accounts which are compliant but having system concerns will be sampled at a slightly higher level to monitor the impact of their system. A non-compliant account will receive port transaction sampling providing a statistically valid indication of acceptable compliance and (unlike compliant accounts) will be subject to national criteria and local initiatives related to their importing area to intervene in ongoing non-compliance.

A key element in the effectiveness of the CM-CA integration is the continued refinement of the Customs sampling formula. From the first "risk score" employed in FY 95, Customs has developed objective and data driven refinements. The integration of CA results has greatly enhanced the outcome probability of the formula. In FY 98 the formula will provide the maximum probability of minimizing resource expenditures on compliant imports.

Importer Accounts

The Integrated Trade Compliance System provides a risk assessment for accounts. The subsequent examination level is based on that determination: higher risk leads to more examinations. Results from CM sampling in FY 1997 were consistent with the first CA risk determinations.

| Level of Risk | Compliance Rate |
|-------------------------|-----------------|
| Low Risk Companies | 90% |
| Moderate Risk Companies | 88% |
| High Risk Companies | 80% |

Account Management

Customs has prototyped the concept of Account Management. The Account Manager is assigned an account (importer) or group of accounts and is responsible for overseeing the efficient application of Customs processes to the account(s). By viewing import practices from a corporate or account level, Customs can craft strategies to maximize compliance, and the account benefits by having a single point of contact within Customs.

In FY 1997, Customs had 25 full-time National Account Managers in place and 116 accounts participating in the program. In addition, the prototype of Port Account Management was implemented focusing on major accounts (importers with annual trade value in excess of \$10 million). Successful prototyping led to a January expansion of the program which now includes 120 accounts with further expansion occurring throughout 1998.

While analysis of trade patterns and determination of compliance levels for industries and countries of origin remains critical for effective operations, an account focus is the means for implementing strategies resulting from such analysis. The Account approach enables Customs to assist compliant companies maintain compliance, while better utilizing our resources and processes to focus on non-compliant activities. Such focus will enable Customs to maximize the enforcement of laws and further develop risk management.

Building Upon the Foundation

Customs Integrated Trade Compliance System, for three years, has identified areas which are compliant, allowing resources to be re-allocated in other areas. The system has also identified areas which are non-complaint, indicating where focused informed compliance should occur. After three years of assessing, measuring, rating, and reporting, Customs is making use of its new knowledge to act against areas of non-compliance. A critical component of such action, one which will shape and advance trade Risk Management, is thoroughly anticipating the future condition of importing into the United States. Customs is accepting the challenge.

1997 COMPLIANCE MEASUREMENT HIGHLIGHTS

OVERALL HIGHLIGHTS

- Nationwide port of entry compliance was 81 percent in FY 1997.
- ACS cargo release transactions were 82 percent compliant in FY 1997.
- Line release transactions improved from 71 percent compliance in FY 1995 to 74 percent compliance in FY 1996, to 76 percent in FY 1997.
- Primary Focus Industry compliance rate, as a whole was 83 percent, exceeding the nationwide port of entry average of 81 percent.
- Critical trade issues such as Intellectual Property Rights (IPR) were violative in an extremely small percentage of importations.
- The projected net revenue loss due to improper duty payment was \$210 Million in FY 1997.
- Concerns remained for the improper classification of goods by importers, potentially hindering enforcement activity and skewing trade statistics.
- Compliance of Mexico-originated commodities (cargo and line release) was approximately 90 percent, which is nine percent higher than overall compliance entering all U.S. ports of entry.
- Compliance of Canada-originated commodities (cargo and line release) was approximately 75 percent, which is six percent lower than overall compliance entering all U.S. ports of entry.
- A separate NAFTA Compliance Measurement, prototyped in FY 1997, provided the first indices of compliance with that trade agreement.
- The NAFTA compliance rate was 94 percent.

Note: Four PFI industries, Advanced Displays, Bearings, Manufacturing Equipment and Steel Mill Products, were independently sampled at cargo entry/entry summary processing and entry summary only processing. For these industries, the compliance rate calculated from the entry summary only sample is higher. This is because both cargo inspection and entry summary review were conducted for the cargo sample, while only entry summary review was conducted for entry summary only sample. Two reasons may explain the differences. One is that some of the errors occurring at cargo entry submission may be corrected by the filer or importer when entry summary is submitted. Another is that a physical inspection of cargo followed by an entry summary review can identify more varieties of errors than a review of entry summary only. The two samples are not the same and combining the compliance rates from the two samples is problematic. A weighted average of the two may better reflect the true compliance situation.

The weighted averages of the compliance rates based on the two samples for these four PFI industries are: 83.48% for Advanced Displays, 86.73% for Bearings, 77.59% for Manufacturing Equipment and 86.85% for Steel Mill Products.

Note: This table shows the results of NAFTA verifications completed as of December 31, 1997, at which time 2,904 of the 3,309 sample lines were completed. The sample was selected from March 1996 to April 1997 independent of the overall CM sampling and focused highly on PFI. A sampling adjustment was made on October 1, 1996. Approximately 10 % of the sample is still outstanding. The compliance rates could change when the entire sample is completed. However, the completed sample is sufficiently large that the results provide a valid indication of the actual NAFTA compliance.

SECTION I. CUSTOMS PROCESSING AND SAMPLING METHODOLOGIES

PROCESSING IMPORTATIONS

Customs uses a two-step procedure to process imports entering the United States. The first step involves Customs direct control of the merchandise and release of the cargo after it is determined that the importation is allowed and related information is properly and accurately documented (entry papers). The second step involves a thorough review of the detailed paperwork (entry summary) subsequently submitted, and liquidation of the importation after it is determined that all appropriate trade statistics have been reported and duty payment tendered. For trade compliance purposes, this two-step procedure is referred to as cargo release and entry summary liquidation.

For the past decade, the Automated Commercial System (ACS) has been instrumental in storing and speedily processing import information and managing import related activities. Importation data are usually electronically transmitted into ACS, where a unique entry number is designated for each import transaction. This unique number provides for systematic identity tracking and document control during cargo release and entry summary liquidation processing. It also allows an easy retrieval of information about the transaction whenever needed.

CARGO RELEASE (CR) PROCESSING

Customs identifies entry lines for examination by using an ACS module, referred to as cargo selectivity, to systematically compare entry documentation data with existing data stored in the mainframe computer about actual or suspected import violations and enforcement records or information concerning narcotics smuggling. In addition to cargo selectivity processing, examinations can also result from either a random selection of a shipment for compliance measurement purposes, or a non-systematic targeted selection by a seasoned examination officer. Cargo entry lines that pass the cargo selectivity checks and are not otherwise identified for examination are released immediately.

Examination of cargo, usually performed by a Customs inspector, means physically examining the imported merchandise, comparing the merchandise with the accompanying entry documents and information, and ensuring that the importation complies with import laws governing admissibility, classification, valuation and duty. This process also includes quantity verifications, and when necessary, sampling merchandise for import specialist review and/or laboratory analysis. Violations of import related laws and discrepancies between the submitted documentation and the merchandise found during physical examination are recorded for an appropriate action. Such action could range from correcting clerical errors to seizure and/or detention of the imported merchandise. The results of the examination are recorded in ACS by the examination officer and become a permanent part of the importation record.

ENTRY SUMMARY LIQUIDATION PROCESSING

Ten days after shipments have been released from Customs, importers are legally required to submit more detailed information, referred to as "entry summary," of the importation. The Import Specialist uses this detailed entry summary information to make finer determinations of compliance. In cases where a shipment has been examined, the Import Specialist uses the recorded annotations of the examination officer to ensure the importation is properly classified and the correct duty is paid. The number and complexity of enforcement issues involved in each import transaction will vary based on the nature of merchandise imported. The Import Specialists also must bear in mind whether a specific importation is subject to the provisions of any trade agreements when reviewing the entry summary. To accurately complete an entry summary review, an Import Specialist must sometimes request additional descriptive information from importers, which may lead to further analysis or even an importer interview.

Although many simple reviews can be completed expeditiously, some reviews will take longer to complete because of the issues and complexity involved. Generally, all entry summary reviews are completed within three months. The entry is liquidated at the conclusion of entry summary review processing, reflecting Customs determination of the importer's obligation for the entry. However, because of trade issues, as well as logistical problems inherent in a massive national system, there may be occasional delay in completing this review process.

LINE RELEASE (LR) PROCESSING

A cargo release mechanism, called line release (LR), is a sub-system of ACS that was specifically designed to expedite low-risk, repetitive shipments entered at land border ports of entry. Using LR, both Customs and the importers can save time and expenses since cargo is released at the primary Customs booth when the truck or train is physically entering the U.S.

Importers or their brokers typically apply for LR approval on behalf of a Canadian or Mexican shipper. After approval, Customs issues a code that identifies the commodity, country of origin, and shipper. This code is known as the Consolidated Common Commodity Code or C4 code. This code is entered into a local Customs database when the shipment enters at a land border port. By means of periodical upload to ACS, an audit trail is provided to ensure that an entry summary is properly filed.

The LR system is not totally integrated with the ACS and the design of the system does not allow for a random selection of a sample for compliance measurement purposes in the same way as a selection is made in ACS. Thus, a separate sample is selected for LR importations. LR processes about 12 percent of the import transactions, while the regular cargo release (CR), performed using ACS as described in the previous paragraphs, processes approximately 88 percent. The latter is also referred to as ACS cargo release, to distinguish it from LR. In this report, separate sets of tables are presented for LR and CR.

Customs is in the process of developing a new import processing system, designated as ACE (Automated Commercial Environment). Based on a phase-in process, ACE is expected to replace many ACS functions over the next few years. Additionally, ACE will incorporate LR transactions, eliminating the need for two separate cargo processing systems.

NON-MEASURED POPULATION

Merchandise imported into the United States through the Border Release Program (BREL) was excluded from the FY 1997 CM. BREL processing is not automated and does not allow for implementation of the sampling scheme used in CR or LR. BREL transactions are mainly Canadian origin, and enter through small Northern Border Ports of Entry. In most cases these border ports (called Permit Ports) have no alternative but to use BREL because of the absence of automation. Operationally, the inspector manually reviews the entry documents submitted by the broker to determine whether an examination is necessary. The 10-day clock for the filing deadline of entry summary starts when the cargo is released. An entry number is assigned afterward when the entry is input into the ACS system for tracking entry summary filing.

For FY 1997, there were 311,380 transactions, valued at \$3.4 billion (or 0.4 percent of total import value) processed through BREL. Customs may phase out BREL when small ports are automated.

SAMPLING METHODOLOGY

The primary purpose of the compliance measurement (CM) program is to ascertain trade law port-of-entry compliance from the time of cargo entry to entry summary liquidation. All imported cargo entry lines declared to Customs during FY 1997 constituted the sampling population. The population covers both CR and LR transactions. For CR, the sampling consists of three segments: baseline, primary focus industries (PFI) and compliance assessment (CA) accounts. For CR baseline and LR, the sample size was derived based on the first four digits of the Harmonized Tariff Schedule (HTS) numbers using an allocation method that reflects Customs workload characteristics and compliance history. The details of the allocation method are presented below in a separate section.

There are commodities that Customs considers important and has been focusing attention on in recent years. These commodities are referred to as PFI and are defined by ranges of HTS. In addition to the baseline sample for CR, additional entry lines were selected from some 4- or 6-digit HTS numbers that were identified as having a high concentration of PFI commodities. At least 40 additional entry lines were separately selected for the sample from the population of these 4- or 6-digit HTS numbers to boost the PFI sample.

On an ongoing basis, one of the Office of Regulatory Audit's functions in Customs is to select accounts for CA. The CM sampling for those accounts that had been assessed by Regulatory Audit was separated from the rest of the sampling scheme. While those accounts not compliance assessed were sampled under either a CR baseline, PFI or LR sampling scheme, the sampling of CA accounts depends on the results of CA. As part of the CA sampling scheme, three different categories were designated for the accounts based on the results of CA. These three categories are defined as: highly compliant, compliant but lacking an effective internal control system, and low compliance. Ranging from 30 to 220, the sample size for CA accounts was based on the category to which the account was designated.

In summary, the sample size was determined by 4-digit HTS number for CR baseline and LR, by 4- or 6-digit HTS numbers for PFI and by category for CA accounts. The actual sampling rate was then calculated as a percentage of the corresponding population and implemented to select the sample from the population. The following table summarizes the population size and realized sample size of each sampling segment.

It should be noted that Customs chose not to expend valuable resources to examine entry lines that have a value less than \$1,250. However, within ACS and LR, there exists no systematic way to exclude such entry lines from being sampled. Starting the second quarter of the fiscal year, a manual unset procedure was implemented for CR that allowed supervisory Customs inspectors to override CM examination when the entry line value was less than \$1,250. For purposes of this report, these low value lines were excluded from the tabulation of CR regardless of which FY 1997 quarter the sample was selected. These low value lines are also excluded in the above estimate of the sampled population size. In addition, exclusions are also made for both CR and LR for commodities, identified by 4-digit HTS numbers, for which a cargo examination is not feasible or not necessary. These commodities include hazardous materials, bulk raw materials, oils and importations under special legislation.

ALLOCATION METHOD

An allocation method allows Customs to allocate a larger sample for commodities that are considered important, and a smaller sample for commodities that are deemed less important. It also allows Customs the flexibility to define or choose specific factors that reflect the importance of the commodities. For FY 1997 CR baseline and LR CM, the sample size was allocated based on the 4-digit HTS numbers. A total of four variables was used in the sample allocation process: population size (total entry line count), total value, average value per line, and HTS discrepancy rate as determined by the FY 1995 CM program. A risk score was calculated based on total value, average value and discrepancy rate. The purpose of risk score was to provide an index for reflecting the importance of each 4-digit HTS number relating to Customs workload and focus. The sample size was allocated according to a factor which is the product of risk score, population size, average value, and variance of discrepancy rate, raised to specific powers. The powers for the adopted allocation are shown below.

| Allocation Variable | Power | | | |
|---------------------|-------|--|--|--|
| Population | 0.50 | | | |
| Average Value | 0.25 | | | |
| Risk Score | 0.50 | | | |

| Variance | 0.50 |
|----------|------|

These powers were selected to achieve the desired sample distribution among the 4-digit HTS numbers. The powers could be changed to obtain different allocations reflecting the Customs workload in some other ways; e.g., a sharper increase of the allocated sample sizes when the average value is increased.

Before the allocated sample sizes were adopted, they were evaluated from two prospective angles: the expected precision of the compliance estimates (at 95 percent confidence level), and the expected number of entry lines that would be available for revenue estimations. The expected precision, i.e., margin of error at 95 percent confidence, of the estimates by 4-digit HTS numbers indicates that the allocated sample sizes indeed provide highly reliable estimates of compliance for major commodities of Customs importing workload and focus, as measured by the allocation variables.

In addition, the sample was also assessed by rolling up the allocated sample sizes to the HTS chapter and section levels. The expected margin of error varies by chapter, depending on the allocation parameters. For major chapters, a small margin of error was observed. However, because of the rare occurrences, only a few HTS chapters are expected to have sufficient entry lines for reliable revenue estimation. However, these chapters included most commodities of interest. Sample size fallout was also calculated to assess the workload impact at the service port level.

DEFINING STRATA AND WEIGHTING SCHEME

Even though the sample size was allocated by 4-digit HTS number, these HTS numbers should not be confused with sampling strata. The sample size for each 4-digit HTS number varies widely. To stabilize the sample weight, these 4-digit HTS numbers were combined according to the comparability of the sampling rate to form broader sampling strata. A weighting scheme was developed by such stratum to account for the different sampling rates. Because the sampled populations of CR baseline and PFI overlapped, and because CA account sampling was modified on a quarterly basis by adding additional CA accounts, the overall process of counting the population and sample and developing the weighting scheme was relatively complicated. However, sufficient care was exercised to ensure that the entire process was statistically valid.

STATISTICAL NOTES

To formulate data and provide the statistics in the tables appearing in Sections II and III, it was necessary to extract the data from ACS before all FY 1997 entry summary reviews were complete. As of January 5, 1998, the date when the tabulation and quality review process for this report commenced, about 1,500 entry summaries had not been finalized. However, all cargo examinations were complete and inputs reviewed.

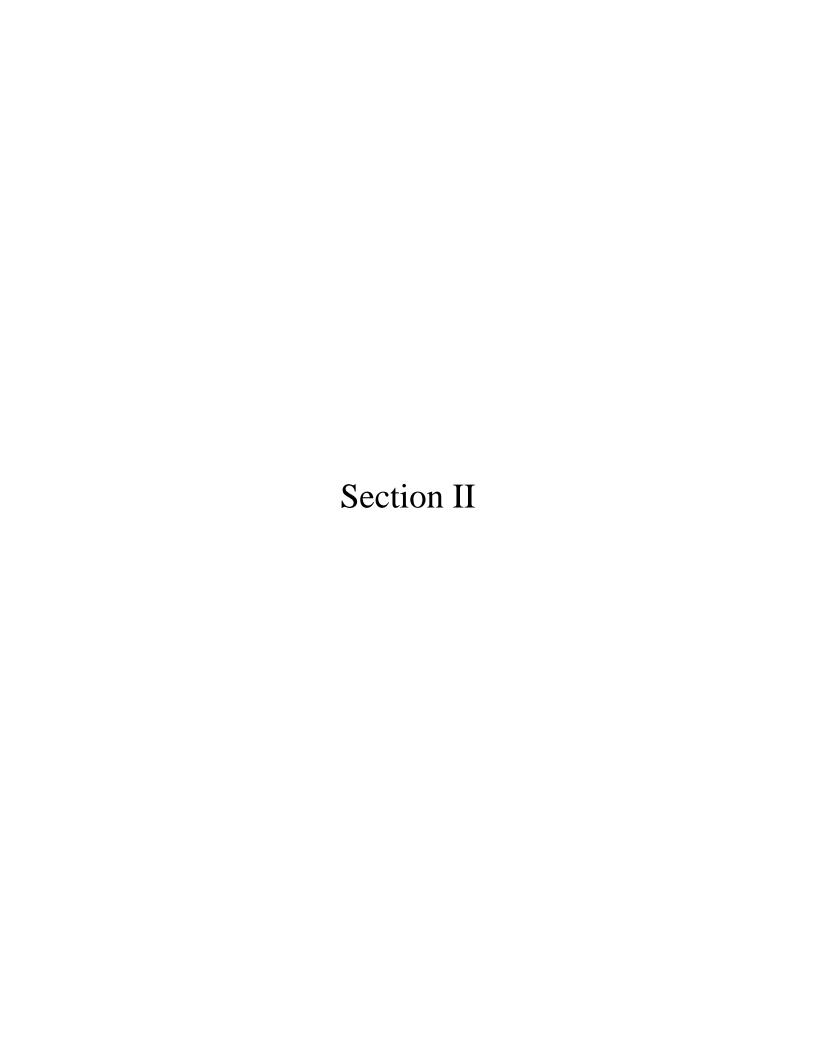

FY 1998 SAMPLING REFINEMENT

Refinements were made for FY 1998 sampling. Samples for CR and LR were allocated separately so that workload and compliance characteristics of CR and LR are each reflected individually. This allocation ensures that the LR sample reflects the workload and compliance situations of LR, because of the CR dominance of the combined population.

The accounts with completed CA or pending CA in FY 1998 are separated from the rest of the CR population. This separation provides a stable population for the baseline sample throughout the fiscal year. Also, the CA sample was allocated based on the total value, average value and total volume, as well as the compliance categories of CA, rather than using a specific sample size that depends on the CA category. This avoids sampling a small account at an excessively high sampling rate.

There were no separate sampling for PFI in FY 1998, instead, PFI sampling is included as part of baseline sampling. A weighting factor was applied to those 4-digit HTS numbers with a high PFI concentration to boost the PFI share of the sample.

These refinements made the FY 1998 sampling cleaner and easier to manage. The allocated sample sizes also better reflect the workload and compliance situations of the 4-digit HTS numbers and of the accounts. Finally, a limit was also applied to the range of the sampling rate to control the undesirable impact due to a wide range of weights.

SECTION II. CM RESULTS FOR ACS CARGO RELEASE

This section contains three sets of tables showing the FY 1997 CM results for ACS Cargo Release (CR), which consists of about 88 percent of the total volume of importations into the United States. These three sets of tables show, respectively, the compliance rates, discrepancy rates and revenue summary, by Harmonized Tariff Schedule (HTS) chapter, by 4-digit HTS number and by country of origin, as listed below.

A. Compliance Rates

- Table II.A.1 FY 1997 CM Compliance Rates for ACS Cargo Release (CR) by HTS Chapter
- Table II.A.2 FY 1997 CM Compliance Rates for ACS Cargo Release (CR) by 4-Digit HTS
- Table II.A.3 FY 1997 CM Compliance Rates for ACS Cargo Release (CR) by Country of Origin
- Table II.A.4 FY 1997 CM Compliance Rates for ACS Cargo Release (CR) by Primary Focus Industry (PFI)

For Tables II.A.2 and II.A.3, only those 4-digit HTS numbers or countries of origin that included at least 25 examinations (i.e., sample size of at least 25) are listed. The reason for this is to not display estimates that are not expected to be reliable and to reduce the size of the table. This implies that the estimates displayed in the tables are at least somewhat accurate and that these HTS numbers or countries have a sufficient volume of entry lines.

These tables show (weighted) compliance rates, and 95% confidence intervals of the compliance rates. The compliance rate is calculated by dividing the estimated population into the estimated total number of compliant lines in the population. A 95% confidence interval is a means to show the precision of the compliance rate estimate. This means that if a sample of the same size were repeatedly taken from the same population and a 95% confidence interval were calculated based on the sample, then the chances would be 95% that the calculated confidence interval would encompass the actual compliance rate in the population.

The confidence interval on each table was calculated using a normal approximation method which only works for a moderately large sample size, e.g., 25 or 50 (or even 100), depending on the range of the actual compliance rate, and with at least a few discrepant lines found. The normal approximation method failed in some situations, e.g., where the 95% confidence has the same lower and upper bounds of 100% or is extremely narrow for

SECTION III. CM RESULTS FOR LINE RELEASE

This section contains three sets of tables showing the FY 1997 CM results for Line Release (LR), which consists of about 12 percent of the total volume of importations into the United States. These three sets of tables show, respectively, the compliance rates, discrepancy rates and revenue summary, by Harmonized Tariff Schedule (HTS) chapter, by 4-digit HTS number and by country of origin, as listed below.

A. Compliance Rates

- Table III.A.1 FY 1997 CM Compliance Rates for Line Release (LR) by HTS Chapter
- Table III.A.2 FY 1997 CM Compliance Rates for Line Release (LR) by 4-Digit HTS
- Table III.A.3 FY 1997 CM Compliance Rates for Line Release (LR) by Country of Origin

For Tables III.A.2 and III.A.3, only those 4-digit HTS numbers or countries of origin that included at least 25 examinations (i.e., sample size of at least 25) are listed. The reason for this is to not display estimates that are not expected to be reliable and to reduce the size of the table. This implies that the estimates displayed in the tables are at least somewhat accurate and that these HTS numbers or countries have a sufficient volume of entry lines.

These tables show (weighted) compliance rates, and 95% confidence intervals of the compliance rates. The compliance rate is calculated by dividing the estimated population into the estimated total number of compliant lines in the population. A 95% confidence interval is a means to show the precision of the compliance rate estimate. This means that if a sample of the same size were repeatedly taken from the same population and a 95% confidence interval were calculated based on the sample, then the chances would be 95% that the calculated confidence interval would encompass the actual compliance rate in the population.

The confidence interval on each table was calculated using a normal approximation method which only works for a moderately large sample size, e.g., 25 or 50 (or even 100), depending on the range of the actual compliance rate, and with at least a few discrepant lines found. The normal approximation method failed in some situations, e.g., where the 95% confidence has the same lower and upper bounds of 100% or is extremely narrow for a moderate sample size. This is misleading due to a normal approximation with a moderately small sample size under an extreme compliance situation. (In this case, there are alternative estimation methods that may yield a more reliable confidence interval.)

B. Discrepancy Rates

- Table III.B.1 FY 1997 CM Discrepancy Rates for Line Release (LR) by HTS Chapter
- Table III.B.2 FY 1997 CM Discrepancy Rates for Line Release (LR) by 4-Digit HTS
- Table III.B.3 FY 1997 CM Discrepancy Rates for Line Release (LR) by Country of Origin

The discrepancy rate is calculated by dividing the estimated total number of discrepant lines of the type of discrepancy in the population by the estimated population. In the above tables, discrepancy rates were displayed for those types of discrepancies or violations that were detected with at least a noticeable frequency. These discrepancy or violation types include: Overall, All Types Except Miscellaneous, Quantity, Quota, Marking, Classification, Other Agency, Trademark and Copy Rights, Value, Country of Origin, AD/CVD, and Miscellaneous. As before, for Tables III.B.2 and III.B.3, only those 4-digit HTS numbers or countries of origin that included at least 25 examinations (i.e., sample size of at least 25) were displayed.

The projected total number of discrepant lines in the population is not included in the tables. This projection can be calculated easily by multiplying the total population by the corresponding discrepancy rate.

C. Revenue Summary

- Table III.C.1 FY 1997 CM Revenue Summary for Line Release (LR) by HTS Chapter
- Table III.C.2 FY 1997 CM Revenue Summary for Line Release (LR) by 4-digit HTS
- Table III.C.3 FY 1997 CM Revenue Summary for Line Release (LR) by Country of Origin

For Tables III.C.2 and III.C.3, only those 4-digit HTS numbers or countries of origin that included at least 50 examinations (i.e., sample size of at least 50) or with at least two examinations resulting in revenue changes are displayed. This exclusion is to avoid displaying revenue estimates whose reliability is extremely questionable and to show only those HTS numbers or countries that have a sufficient volume of entry lines during FY 1997.

The above tables contain total refunds and recoveries in the sample, as well as projected total refund, recovery, activity and revenue gap within the population. The projected total refund represents the total amount the government should refund the importers with total compliance. The projected recovery represents the total increase in revenue the government should receive from the importers with total compliance. The projected total activity is the sum of projected total refund and projected total recovery, constituting the

total revenue impropriety due to non-compliance. This projected total activity is included to indicate the absolute magnitude of the impact due to non-compliance. The projected total revenue gap represents the total revenue not collected by the government due to non-compliance.

A 95% confidence interval is also included in Table III.C.1 to show the precision of the estimated revenue gap. This means that if a sample of the same size were repeatedly taken from the same population and a 95% confidence interval of the revenue gap were calculated based on the sample, then the chances would be 95% that the calculated confidence interval would encompass the actual revenue gap in the population.

A confidence interval provides an indication of the precision of the estimate of the actual revenue gap in the population. However, it should be stressed that the point estimate is projected revenue gap and it represents the most likely occurrence of actual revenue gap that the statistical method can provide.

SECTION IV. NAFTA COMPLIANCE MEASUREMENT

The FY 1996/1997 NAFTA compliance measurement sampling was centered around the Primary Focus Industries (PFI), ensuring adequate sampling levels for these critical areas. This sample was conducted in addition to the overall CM activities. There were several reasons for conducting a separate sample: (1) determining compliance for NAFTA is more complex than other trade issues; (2) a specified sample for NAFTA could not be accomplished in an automated mode off the FY 1997 overall CM sample; and (3) NAFTA, as a relatively new issue, was still undergoing analytical process development.

NAFTA Verification Process

NAFTA verifications, which ultimately lead to origin determination, are a complex and lengthy process. Import specialists and regulatory auditors are responsible for conducting NAFTA verifications, and Customs port directors issue origin determinations.

Verifications can be conducted by a number of methods: documentation, a visit, or an audit. The process of conducting a NAFTA verification and the analysis that must be done by Customs to determine whether or not the NAFTA claim is legitimate is complex and lengthy, due in large part to the language in the Agreement and the implementing regulations. The Agreement requires that the exporter and importer be given "reasonable" time to reply to a Customs request. For U.S. Customs, reasonable time is 30 days. For example, in order to begin the NAFTA verification process, Customs must request the Certificate of Origin from the importer and allow 30 days for the importer to provide the Certificate.

It should be noted from the onset that any NAFTA claim involving a regional value content calculation using the net cost method cannot be started until 180 days after the end of the production period which could be one year after the date that an entry was selected for a NAFTA verification. Once the Certificate is received and analyzed by Customs officers, a verification can be initiated with Customs requesting further information from the exporter to support the claim.

Customs must allow 30 days for the exporter's response; however, getting the required information from the exporter frequently takes several months due to incorrect information being sent or a general lack of understanding on what to send. Upon receiving all the information required, Customs will analyze the information and determine whether or not the goods being imported qualifies for preferential (NAFTA) treatment. The documentation to be analyzed could be items such as income statements, bills of materials, production records, etc. Customs is allowed 60 days from the date all the information is received to make an origin determination.

A verification that does not involve a plant/exporter's premises visit and runs smoothly takes about 180 days to complete. If the import specialist determines that a visit to the exporter's plant is required which is usually in addition to the paper documentation, another 2 months must be

added to the NAFTA verification process as the Customs officer must receive country clearance, advise the foreign government of the intent to visit, notify the exporter of the intent to visit, receive consent from the exporter for the visit, and then conduct the visit. Perhaps this visit is just to view the production process, but the visit could entail looking at and analyzing plant production records, producers books, etc. Approximately 330 visits were undertaken during this reporting period.

As NAFTA is a relatively new and unique trade agreement, there is little legal precedence to guide the Customs officer in making decisions and determinations; for example, concerning the application of the specific rules of origin or what is or is not to be included as originating costs in a regional value content calculation. Therefore, in addition to the lengthy external communications process, whenever the Customs officer seeks legal or procedural guidance from the National Import Specialists or Customs attorneys, delays of two months or longer, can be anticipated in the issuance of a NAFTA determination.

Due to the time constraints, and the complex analytical and determination issues cited above, 10% of the total number of 3,309 verifications assigned to the ports during FY 1997 have yet to be completed. As of Decmber 31, 1997, 2,904 NAFTA verifications were completed. That number enables Customs to issue specific rates of compliance for NAFTA claims with statistical validity.

FY 1998 NAFTA Measurement Plan

For FY 1998, standardized analytical techniques for NAFTA claims have been developed and are applied to all CM findings. These techniques are an addendum to the National Compliance Measurement Operational Plan. NAFTA is an issue within compliance measurement, not separate from (or in addition to) compliance measurement. In addition, 1000 NAFTA CM verifications will be conducted with mandatory extensive follow-up procedures. This will enable Customs to measure the effectiveness of the analytical techniques developed to provide an overall CM rate, and, provide a CM rate where mandatory verification is a component. If the rates are similar, Customs will be able to issue projections of the implications of NAFTA non-compliance the same as is contained for overall importations.

FY 1996/1997 NAFTA Compliance Verification Results

The NAFTA sample was selected from March 1996 to April 1997 independent of the overall CM sampling and focused highly on PFI. A sampling adjustment was made on October 1, 1996. As of December 31, 1997, 2,904 NAFTA verifications of the 3,309 sample lines were completed. The following four tables contain the results of completed NAFTA verifications. These four tables show the compliance rates by Harmonized Tariff Schedule (HTS) chapter, by 4-digit HTS number, by country of origin and by PFI category, as listed below. However, it should be noted that both the compliance and population estimates shown in these tables reflect only the part of the sampled population represented by the completed sample.

Table IV.A.1 FY 1996/1997 NAFTA Compliance Rates by HTS Chapter

Table IV.A.2 FY 1996/1997 NAFTA Compliance Rates by 4-Digit HTS Number

Table IV.A.3 FY 1996/1997 NAFTA Compliance Rates by Country of Origin

Table IV.A.4 FY 1996/1997 NAFTA Compliance Rates by PFI

For Tables IV.A.1 and IV.A.2, only those chapters or 4-digit HTS numbers that included at least 25 verifications (i.e., sample size of at least 25) are listed. The reason for this is not to display estimates that are not expected to be reliable. This implies that the estimates displayed in the tables are at least somewhat accurate and that these chapters or HTS numbers have a sufficient volume of NAFTA claim summary lines.

These tables show (weighted) compliance rates, and 95% confidence intervals of the compliance rates. The compliance rate is calculated by dividing the estimated total number of compliant lines in the population by the estimated population. A 95% confidence interval is a means to show the precision of the compliance rate estimate. This means that if a sample of the same size were repeatedly taken from the same population and a 95% confidence interval were calculated based on the sample, then the chances would be 95% that the calculated confidence interval would encompass the actual compliance rate in the population.

The confidence interval on each table was calculated using a normal approximation method which only works for a moderately large sample size, e.g., 25 or 50 (or even 100), depending on the range of the actual compliance rate, and with at least a few discrepant lines found. The normal approximation method failed in some situations, e.g., where the 95% confidence has the same lower and upper bounds of 100% or is extremely narrow for a moderate sample size. This is misleading due to a normal approximation with a moderately small sample size under an extreme compliance situation. (In this case, there are alternative estimation methods that may yield a more reliable confidence interval.)
